Best Management Practices For Vehicle Repairs

In order to reduce the potential for storm water pollution, the Utah Division of Water Quality has requested that all activities related to vehicle maintenance be performed in an area where spills of motor oil and other engine fluids can be adequately contained. To prevent such fluids from becoming a pollution source, vehicle maintenance activities should be performed within maintenance bays. If repairs must be made outside maintenance bays, all fluids and other potential contaminants must be contained using drip pans or other appropriate means.
